

3.5D Seismic

What is 3.5D seismic?

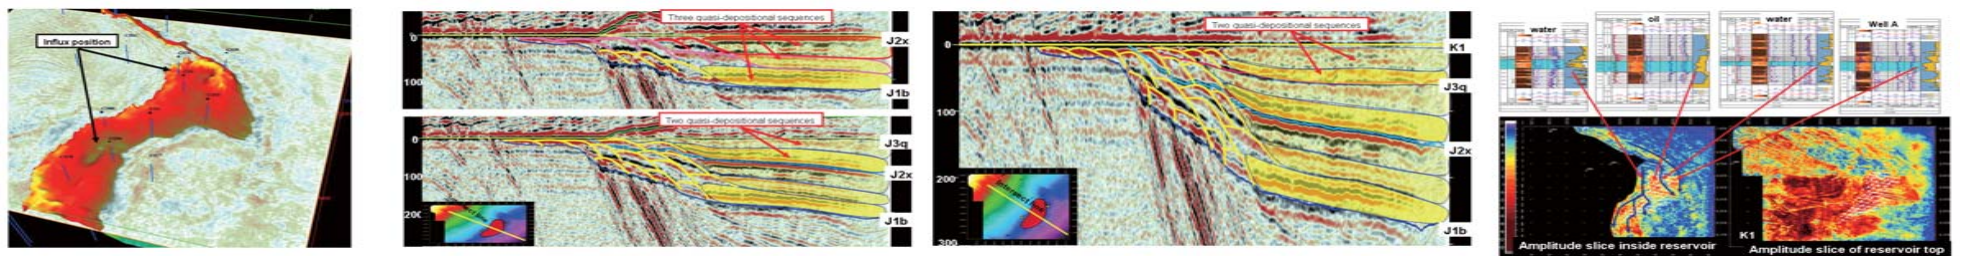

3.5D seismic is the technique used to predict remaining oil, which integrates high-quality 3D seismic with dynamic reservoir information in the later stage of the oilfield.

3.5D seismic application case study 1:

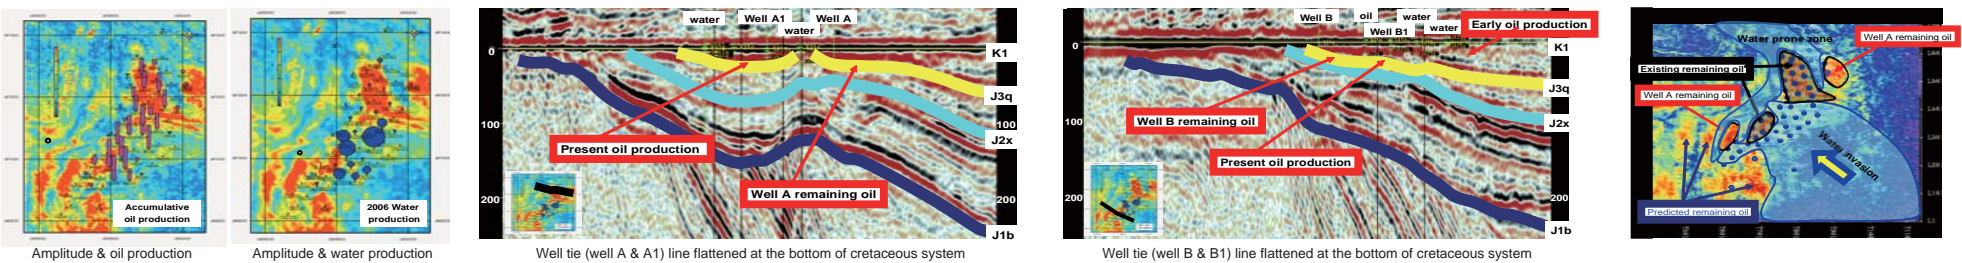

1) development and seismic background

2) structural and depositional evolution study

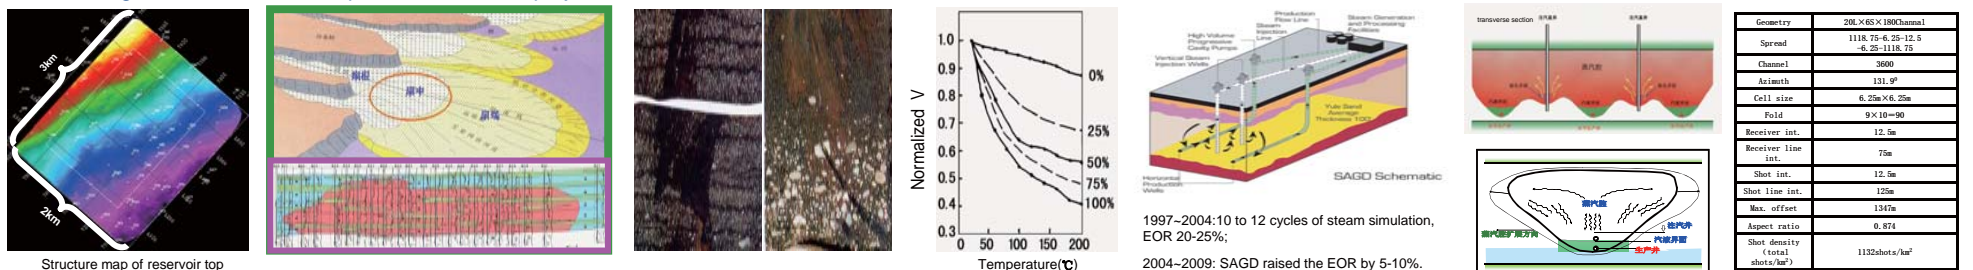

3) 3.5D interpretation of 3D seismic and reservoir dynamic

3.5D seismic application case study 2:

1) background of oilfield development and seismic project

2) 3.5D interpretation of reservoir simulation and seismic
